ABOUT ME

My name is Andrej, and I am an enthusiastic software developer with a passion for learning and mastering new technologies. I take thorough approach to understanding concepts I encounter to be able to apply them effectively. I care about software quality and maintainability. Sharing knowledge is equally important to me; I enjoy mentoring colleagues and occasionally teaching students.

My current specialization is Frontend development, supported by my academic background in computer science from multiple universities. My studies covered general software development, providing me with a broad perspective on the field before I chose to focus on frontend. I was drawn to this specialization because of its dynamic nature and environment. With my approach, I believe I could be a good fit for senior lead role: having multi-year experience in JavaScript-based environments, core software engineering knowledge to determine best practices and architecture for a given frontend technology stack, leading and mentoring colleagues, and providing bridge between frontend team with other teams.

As a colleague, I am friendly, outgoing, creative and I can mediate technical details and informations to my non-developer colleagues, superiors or stakeholders with ease. When it comes to teamwork, I am proactive, responsible and accountable. In my migration ambassador role, I was also responsible for delegating tasks, performing analyses and estimations, and designing and implementing architectural improvements.

Programming and building applications is my hobby as well. In my free time, I work on my personal projects, several of them are published open source on my GitHub and NPM. They are either small fullstack cloud-based web apps, desktop applications, JavaScript libraries, template starter repositories, or personal automation software.
